Device Package Guide	back cover

With an increasing trend toward systems on a chip, programmable logic device (PLD) vendors must supply increasingly complex products that meet new levels of I/O density and performance. To address these needs, PLD technology is advancing rapidly, allowing for more complex logic to be placed in an ever smaller die area. Today, entire digital subsystems can be implemented on a single PLD. As this trend toward system integration continues to drive the need for higher I/O counts in less board area, space-saving packaging technology is becoming a more critical factor. With an offering of complex, high-performance device families based on its high-density FLEX® and MAX® architectures, Altera has taken a leadership role in packaging innovation for users of high-density PLDs. These packaging solutions allow designers to fully harness the power of programmable logic devices for complex system integration.

Need for New Packaging Technologies

As increased system integration continues to drive the trend toward higher pin counts, traditional packages such as quad flat pack (QFP) packages can no longer provide the required board area efficiency for devices requiring greater than 240 pins. As shown in Figure 1, almost 50% of designs require more than 240 pins. The trend toward higher pin count has led to the emergence of new packages. Figure 2 shows the growth and decline of various package types.

The popularity of ball-grid array (BGA) packages, along with chip scale packages (CSP) and Flip Chip packages, is on the rise because they offer higher pin counts in significantly less board area than QFP packages. Also, BGA packages are robust, provide improved manufacturability, and have better thermal characteristics than most QFP packages.

Figure 2. IC Package Type Usage

Figure 1. Percentage of ASIC Design Starts by Pin Count

Emergence of BGA Packages

At the forefront of packaging technologies, BGA packages have a distinct advantage in cost and ease of production (Figure 3). They are inexpensive and do not require any specialized manufacturing equipment. BGA packages are quickly becoming the most preferred packages for high-density PLD designs because they support high pin counts, easy handling, and volume manufacturing. As a result, Altera has introduced numerous devices in this package type.

Altera has taken a leadership position in providing advanced BGA packaging solutions. With the FineLine BGA™ package, Altera offers the most space-efficient and cost-effective packaging for high-pin-count devices in the PLD industry. Figure 4 shows the various package types with respect to package area and pin count.

FineLine BGA Packaging

Altera's FineLine BGA strategy will provide a path for support of future PLDs with pin counts in excess of 1,000 pins. FineLine BGA packages currently are available in 1.0-mm ball pitch, and in the future will be offered in 0.8-mm and 0.5-mm ball pitch, supporting I/O count and board area requirements for system-level integration and the next generation of high-density PLDs.

Altera's Commitment

Altera is committed to offering its customers programmable logic solutions that are at the forefront of technology. At Altera, one of our goals is to improve your time-to-market with the latest technologies and package options so that our devices can meet your needs today and in the future.

Vertical Migration Capability

Altera devices have been developed to offer maximum design flexibility and ease of use. Package migration, available in Altera’s MAX and FLEX product families, allows users to move freely from one device to another without the need to change board layout. This flexibility enhances both ease of use and time-to-market. Vertical migration allows you to move your design from one density device to another density device in the same package and pin count, enabling you to maintain the same pin assignments while adding or removing logic requirements. The following pages contain actual-size photographs with dimensions for each package, as well as information on vertical migration. Table 1 below shows sample information on vertical migration; all devices that support vertical migration are highlighted in a common color.

Cross-Package Migration with SameFrame Pin-out

In addition to vertical migration, Altera’s FineLine BGA packages offer migration capability between packages with different ball counts. Altera’s innovative SameFrame™ pin-out makes this flexibility possible. With SameFrame pin-out, the layout of balls is such that the smaller ball-count packages form a footprint-compatible subset of the larger packages. This layout of balls gives you the benefit of migrating from one FineLine BGA package to another without having to re-layout your board. By laying out the board for the “worst case” FineLine BGA ball count, the designer maintains the flexibility to choose from any density or FineLine BGA ball count before the design is finalized.

Figure 5 illustrates a cross-package migration example in which you start your design in a 100-pin FineLine BGA and want the flexibility to move to a 256-pin FineLine BGA for a higher I/O count in the future. Similarly, you could start your design in the 256-pin FineLine BGA for maximum prototyping flexibility and then choose to migrate to the 100-pin FineLine BGA for lower cost. Either way, the SameFrame pin-out provides a new level of package migration flexibility.

Table 1. Sample Vertical Migration Table

Package Type	MAX 7000A	FLEX 6000	FLEX 10KA	FLEX 10KE

Vertical Migration | Vertical Migration | Vertical Migration

Figure 6 illustrates how the innovative concentric ball layout is achieved with the new packaging. The power and ground pins in yellow are common to all FineLine BGA packages. With higher ball-count packages, more power and ground pins are present, these pins are located in each corner and are shown in green.

Design Migration Flexibility

You can increase device density and/or I/O count without re-laying out your board. This density and I/O pin migration capability gives you additional design flexibility beyond what you can achieve with vertical migration.

Faster Time-to-Market

Because the SameFrame pin-out allows a single PCB layout to support multiple device density/package combinations, you can now layout your board prior to final device selection. This increased flexibility allows you to concentrate on your design functionality rather than focus on fitting your design in a particular device or package.

Dual Cost Savings

SameFrame pin-out allows you to start with a larger device for prototyping flexibility and migrate to a lower-density, lower-cost device for volume production. You also have the option to migrate from a higher pin-count package to a lower pin-count package to save even more.

Table 2 shows devices offered in FineLine BGA packages. Devices in the same color support cross-package migration.
